Computer Vision Laboratory Unseen Spacecraft Pose Estimation

Baseline solution by implementing a machine learning framework with target models included

Bachelor's Thesis in Computer Science

Author: Jérémy Chaverot

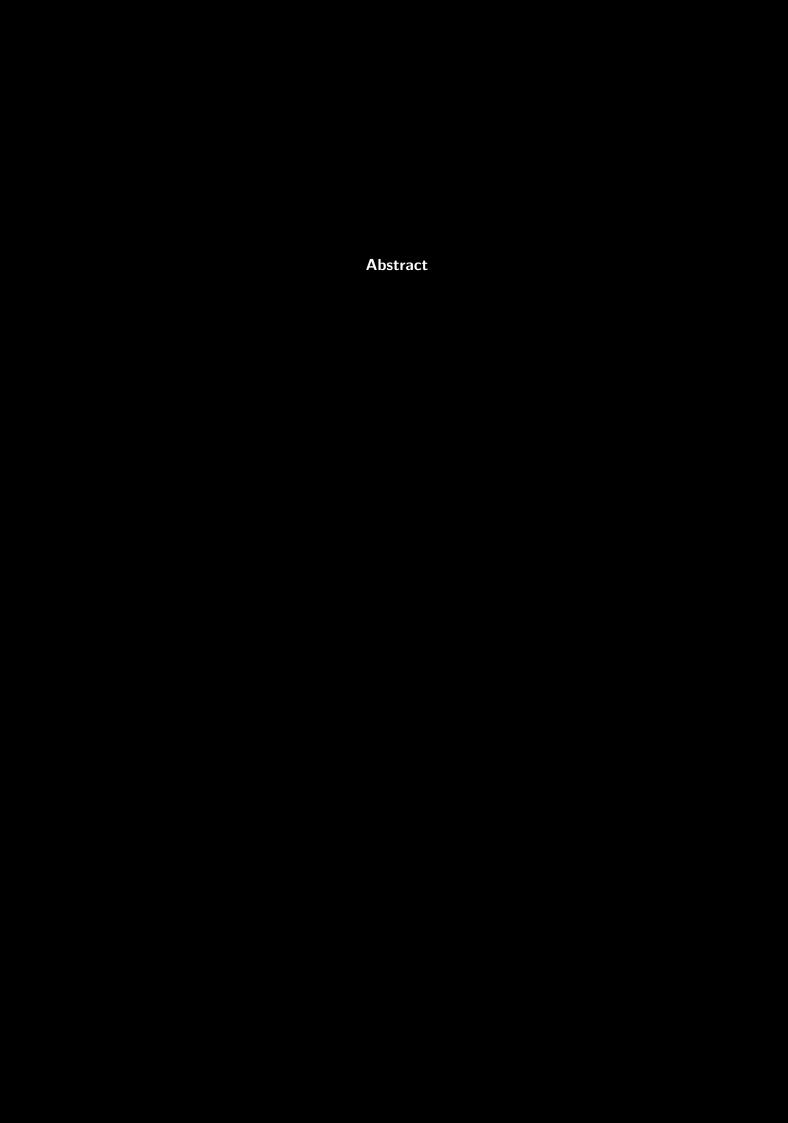

Supervisor: Prof. Dr. Mathieu Salzmann Advisor: Dr. Andrew Price, PhD. Chen Zhao

Semester: Fall 2023

I hereby confirm that I am the sole author of that I have compiled it in my own words. Fand content by the advisors.	of the written work here enclosed and Parts excepted are corrections of form
Lausanne, Switzerland, 05.01.24	Jérémy Chaverot

Acknowledgments

Before delving into the topic, I'd like to express some acknowledgments. First and foremost I must thank my advisors Andrew Price and Chen Zhao for accepting my request to take part in a semester project under their guidance. I am grateful to have been able to practice my skills with them, and can only hope that the feeling is mutual. Moreover I would also like to thoroughly thank my friends and family for supporting me in my academic journey, despite a rather unstable start in my studies.

1 Introduction

Test ref to Listing A.1. Test ref to Listing A.3

1.1 Problem statement

- 1.1.1 The settings
- **1.1.2** The goal
- 1.2 The work environment: Scitas Izar

Test to refer to the video from 3B1B: [2].

```
#!/bin/bash
#SBATCH --chdir /scratch/izar/jchavero
#SBATCH --partition=gpu
#SBATCH --qos=gpu_free
#SBATCH --gres=gpu:2
#SBATCH --nodes=1
#SBATCH --ntasks-per-node=1
#SBATCH --cpus-per-task=1
#SBATCH --mem 16G
echo
echo "Loading modules"
echo "Launching the virtual environment"
source
echo "Navigating to the directory and executing the task"
cd
       eval
echo
```

Listing 1.1: Bash script execute.sh to run a machine learning model on Scitas Izar EPFL. While the overall structure remains consistent, this script is specific to Gen6D's architecture, further discussed later.

Then to run the script we use the following command:

```
$ sbatch execute.sh
```

Listing 1.2: Linux command to run the bash script.

2 Scientific papers review

- 2.1 Some ML models
- 2.2 Gen6D: Pros and cons

3 Gen6D: formal description

- 3.1 Overview of the network
- 3.2 Detection
- 3.3 Viewpoint selection
- 3.4 Pose refinement
- 3.5 Results on LINEMOD

4 Implementation of the model

4.1 Data loader

abstract base classes (ABC) each and every abstract method

4.2 Issues and proposed solutions

- 4.2.1 Issues No. 1
- 4.2.2 Issues No. 2

5 Experimental results and analysis

5.1 Spacecraft dataset characteristics

5.2 Vizualisation of results

5.3 Evaluation metrics

To appreciate the quality of the estimations, the most widely used pose error functions are the Average Distance of Model Points (ADD) and the Average Closest Point Distance (ADD-S) metrics, both introduced by Hinterstoisser et al. [3]. For an object model \mathcal{M} , we compute the average distance to the corresponding model point. Therefore the error of an estimated pose $\hat{P}=(\hat{R},\hat{T})$ w.r.t. the ground truth pose $\bar{P}=(\bar{R},\bar{T})$ is calculated as follows:

$$e_{\text{ADD}}(\hat{\boldsymbol{P}}, \bar{\boldsymbol{P}}, \mathcal{M}) = \underset{\boldsymbol{x} \in \mathcal{M}}{\text{avg}} \left\| \bar{\boldsymbol{P}} \boldsymbol{x}^* - \hat{\boldsymbol{P}} \boldsymbol{x}^* \right\|_2^1$$
 (5.1)

$$= \underset{\boldsymbol{x} \in \mathcal{M}}{\operatorname{avg}} \left\| (\bar{\boldsymbol{R}} \boldsymbol{x} + \bar{\boldsymbol{T}}) - (\hat{\boldsymbol{R}} \boldsymbol{x} + \hat{\boldsymbol{T}}) \right\|_{2}$$
 (5.2)

When the model \mathcal{M} has symmetries that leads to no indistinguishable views, the error is computed as the average distance to the closest model point:

$$e_{\text{ADD-S}}(\hat{P}, \bar{P}, \mathcal{M}) = \underset{x_1 \in \mathcal{M}}{\text{avg}} \min_{x_2 \in \mathcal{M}} \left\| \bar{P} x_1^* - \hat{P} x_2^* \right\|_2$$
 (5.3)

$$= \underset{x_1 \in \mathcal{M}}{\text{avg}} \min_{x_2 \in \mathcal{M}} \left\| (\bar{R}x_1 + \bar{T}) - (\hat{R}x_2 + \hat{T}) \right\|_2$$
 (5.4)

It's important to point out that $e_{\rm ADD-S}$ is more lenient compared to $e_{\rm ADD}$, and should only be applied in cases where there is a definite presence of symmetry in the object and the estimated pose is already notably precise. Otherwise, using $e_{\rm ADD-S}$ becomes irrelevant since the estimation is advantaged.

5.4 Quantitative evaluation

¹In this context, the vector x^* represents a vector that has been extended by appending a 1, specifically for the purpose of matrix multiplication.

6 Ways of improvements

6.1 Specialized spacecraft training set

6.2 Improved object detection algorithms

Rely more on the 3D model (for now only the size) and the segmented images, would optimize for symmetric and irregular shaped spacecrafts

6.3 Robustness to occlusion

7 Conclusion

Limitations Acknowledgments My personal contribution
